DETAILED ACTION***Double Patenting***

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 44 – 91 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 18 - 23 of copending Application No. 09/677421 in view of Takahashi (US Patent 5,018,198).

The application 09/677421 discloses all the subject matter claimed except a inverse fast Fourier Transform to convert the modulated signals into an IFFT converted signal, and transmit the IFFT converted signal and fast Fourier transform the received signal to produce multiple data streams.

Takahashi teaches Inverse Fourier transform to combine the plurality of data streams and transmit the combined data stream and at the receiver to use a Fast Fourier Transform to separate the combined signals (figure 1 and 2). Therefore it would

Art Unit: 2634

be obvious to an ordinary skilled in the art at the time the invention was made to modify the system in the copending application using the teachings of Takahashi's teachings to obtain a communication system wherein plurality of data streams would transmit using a single channel.

This is a provisional obviousness-type double patenting rejection.
